

ScanWise AI

Next-Generation Multimodal
Clinical Intelligence Platform.

Unified Diagnostic Reasoning
Across Imaging, Laboratories,
and EHR Ecosystems.

The Diagnostic Paradigm Shift

Traditional Ecosystem

Data Ecosystem

Images isolated on PACS,
Labs in separate portals

Transplant Operations

Manual UNOS scoring and
siloed transit logistics

Patient Engagement

Jargon-heavy, confusing
patient portals

ScanWise AI Platform

Data Ecosystem

Auto-correlated visual
and biochemical data

Transplant Operations

Real-time algorithmic
UNOS matching with active
mission simulation

Patient Engagement

AI-translated, empathetic
plain-language summaries

The Clinical Intelligence Stack

The Agentic Workflow Paradigm

Step 1: Multimodal Agentic Ingestion

Step 2: The Dual-Engine Pipeline

Engine 1: Gemini 3 Flash

High Volume, Low Latency

- Rapid OCR
- Document parsing
- Rapid summarization

Feature: Powers Live Peer-Review voice assistant (Gemini 2.5 Native Audio) for hands-free surgical consultation.

Engine 2: Gemini 3 Pro-Preview

High Complexity, Deep Reasoning

- Cross-modal differential diagnosis
- Complex transplant matching

Feature: Dynamic ROI Heatmapping (coordinate mapping for lesions and anatomical variants).

Step 2: Cross-Modal Correlation Engine

Step 3: Grounding & Operational Triage

Predictive Workload

Forecasts arrival density and triage pressure.

Regional Trauma Mapping

Identifies nearby Level 1 Trauma Centers and active recovery capacity.

System Briefing

Current queue velocity is optimal. 14 critical scans pending. Recommended diversion to Secondary Imaging Suite due to projected 15% influx.

Modality Mix

-  MRI
-  CT
-  X-Ray
-  Ultrasound

Visualizes active scan distribution to optimize equipment.

Step 3: Transplant Intelligence Hub

Cold Ischemia Time (CIT) Viability Timeline

Core Capabilities

Statutory Compliance 
Automated MELD, EPTS, and LAS score calculations via UNOS/OPTN standards.

Logistics Tracking 
Real-time CIT monitoring with organ-specific viability windows.

Matching Engine 
Multi-factor correlation of blood type, HLA markers, and morphology.

Step 4: Patient-Centric Communication

Step 5: The EHR Bridge (FHIR R4)

Audit Feature: Immutable log of all FHIR data pushes/pulls for regulatory transparency.

Synthesis: The Clinical Handshake

1. For the Clinician

A technical differential diagnosis with ROI heatmaps.

2. For the Patient

A translated, empathetic narrative summary accessible via mobile.

3. For the Hospital System

An automated FHIR R4 payload cleanly mapped directly into the Epic Problem List.

One diagnostic event. Three tailored ecosystems. Zero data silos.

Regulatory & Safety Alignment

ScanWise AI is a Clinical Decision Support (CDS) tool. It is intended to assist healthcare professionals by providing data synthesis and correlation. It does not replace independent clinical judgment or certified medical diagnosis. All transplant allocations must follow national procurement protocols and be verified by a Human Transplant Coordinator.
